

Asset specs & brand guide

Every image slot on the website, at the size it actually renders, with the palette and type rules that govern them. Built so you can size, colour and export an asset correctly without reading the codebase.

Version 17 Sep 2026 Palette & type locked — approved 2026 refresh Content width 1200px max
Density supply at 2× — one exception, §07

01 / read before anything else

Three rules that override every other page here

These are not preferences and they are not negotiable at the design stage. Work that breaks one of them gets sent back regardless of how good it is.

LOCKED The logo is used as-is. Never redrawn.

Do not redraw, recolour, distort or re-typeset the lockup. Do not extract a piece of it. Do not set the wordmark in a lookalike font. The "Market" lockup is the master mark everywhere — header, hero, footer — and Location pages set their own name in type beside it rather than getting their own mark.

One carve-out, approved 27 Aug 2026: the paddle alone is the icon mark, for the small square slots the lockup physically cannot fill — favicon, app icon, avatar. There it ships flat white on a navy disc, which is a recolour, and the 16px size carries a deliberately thickened paddle. That approval covers the icon and nothing else. A bare paddle never stands in for the lockup in the header, the hero, or any other lockup slot.

CULTURAL GUARDRAIL Do not draw Coast Salish formline.

Coast Salish formline is specific to Lummi Nation, and imitations — hand-drawn, stock or AI-generated — can be inaccurate or appropriative. Every motif currently in the build is a flat placeholder silhouette that looks like a placeholder *on purpose*: a convincing imitation is the failure mode, not the goal.

Final art must be authentic, commissioned, or tribe-approved before launch. If you are supplying interim art, keep it to simple flat silhouettes from the approved subject list — canoe, paddle, eagle, salmon, orca, crab, moving water — and mark every file `TOD0: replace with approved Lummi art`.

SCOPE Other Lummi companies appear exactly once.

The wider corporate group is represented by a single footer link reading "Lummi Commercial Companies" and nowhere else — not in artwork, not in copy, not in navigation. Do not introduce a second logo, a parent-company endorsement line, or a corporate lockup anywhere in an asset.

The palette, in hex and RGB

Eight tokens, approved and locked. Navy is dominant; teal and cedar are accents; the waterline is the recurring signature. Do not add colours beyond these.

--lb-navy Identity and structure. Headers, headlines, labels, primary buttons. HEX #1C4E8F RGB 28, 78, 143	--lb-navy-deep Fuel prices and emphasis only. Reserved — not available for decoration, so prices stay a recognisable cue. HEX #14396B RGB 20, 57, 107	--lb-teal Accent, dividers, and the waterline motif. Decorative — never small text. HEX #0FB5C4 RGB 15, 181, 196	--lb-cedar Warm accent, decorative only. Fails AA as small text on light grounds. HEX #C9772E RGB 201, 119, 46
--lb-ground Page background. The warm off-white everything sits on. HEX #FBF9F4 RGB 251, 249, 244	--lb-paper Cards and raised surfaces. HEX #FFFFFF RGB 255, 255, 255	--lb-ink Body text. A warm near- black, not a neutral grey. HEX #2A2820 RGB 42, 40, 32	--lb-bone Text and rules on navy fills. Also the ring around the tab icons. HEX #F5F1E8 RGB 245, 241, 232

Two blues that are inside the artwork and are not UI colours

#000F9F (0, 15, 159) is the original brand blue and lives *inside the logo file only*. #1D3D7C (29, 61, 124) is the navy actually present in the supplied raster art. Neither is a UI colour and neither may be sampled out of the logo and used on a surface — the interface navy is #1C4E8F . Picking a colour out of the logo with an eyedropper is the most common way this rule gets broken.

Contrast, as a working rule

Body text must reach WCAG AA, 4.5:1. Navy, deep-navy and ink all pass on ground and paper. **Teal and cedar do not** — they are large-graphic colours. If an accent has to carry small text, darken it first and measure it; do not assume. Where an element crosses both light and dark grounds, this project's established fix is a bone #F5F1E8 rim, which is why the tab icons carry one: without it the navy disc measured 1.19:1 on Chrome's dark chrome and simply dissolved.

Two faces, one scale

Both are Google Fonts and licence-clean. No third family, in artwork or on the site.

ROLE	FACE	WEIGHTS	SETTING
Display & headings	Space Grotesk	700	Line-height 1.1. Sentence case.
Body, labels, UI	Inter	400 / 500 / 600	Line-height 1.5. Sentence case.

Type scale, in rem: 3 · 2.25 · 1.75 · 1.375 · 1.125 · 1 · 0.875. Stay on it. The logo's own capitals belong to the logo and are not a type rule — do not set headings in all-caps to match it.

Already supplied — do not recreate these

These files exist and are approved. They are listed so you know what is already covered, and so a rename or a re-export never happens by accident.

FILE	PIXELS	INK	WHERE IT RENDERS
logo-market-on-dark.png	336 × 120	White wordmark, cedar paddle	112 × 40 desktop header 95 × 34 phone header
logo-market-on-dark@3x.png	1008 × 360	Same art, 3× density	Loaded through <code>srcset</code> only — never as <code>src</code>
logo-market-on-light.png	512 × 512	Navy wordmark	146 × 52 hero desktop 123 × 44 hero phone
favicon-16x16.png	16 × 16	White paddle on navy, bone ring	The common browser tab
favicon-32x32.png	32 × 32	as above	Retina tab
favicon.ico	16 / 32 / 48	as above	Legacy browsers, bookmark bar
apple-touch-icon.png	180 × 180	No ring — OS masks it	iOS home screen
android-chrome-192x192.png	192 × 192	No ring	Android
android-chrome-512x512.png	512 × 512	No ring	Android splash

The filename names the background, never the ink

`on-dark` holds the **white** wordmark, for dark grounds. `on-light` holds the **navy** one. The name answers "what do I put this on", never "what colour is it" — those readings are opposites, and an earlier naming pair got swapped, which would have shipped a navy wordmark on the navy header at 1.6:1, invisible, on every page. If you ever rename or re-supply these, check the result by opening the file, not by reading its name.

One trap worth knowing: `logo-market-on-light.png` is a 512 square with about 65% of its height empty. Sized by width it renders roughly 146px tall to show 46px of logo. That is fine in the hero and wrong anywhere tight — crop to the ink first.

The measurements the page itself is built to

Section 06 sizes the artwork that goes *into* the page. These are the numbers of the page around it — the column, the scales, the bar heights and the hit areas. They are here so an asset can be checked against the space it has to live in.

MEASURE	VALUE	NOTE
Content column	1200px max	Everything is centred in it. Full-bleed bands (waterline, footer) cross it; content does not.
Phone content column	≈351px	On a 375px device — the widest common phone. Design to 351, check at 320.
Spacing scale	4 · 8 · 12 · 16 · 24 32 · 48 · 64 · 96	Nine steps. A gap that is not on this list is a mistake, not a refinement.
Type scale (rem)	3 · 2.25 · 1.75 · 1.375 1.125 · 1 · 0.875	At a 16px root: 48 · 36 · 28 · 22 · 18 · 16 · 14.
Line height	1.1 / 1.5	1.1 display, 1.5 body. Sentence case throughout.
Corner radius	8px / 12px	8 on controls, 12 on cards. Soft, no heavy shadows.
Waterline band	full width × 18px	Vector. The recurring signature, teal into navy.
Sticky header, phone	56px	About 7% of a 375×812 screen, held permanently. It grew 47 → 52 → 56 for measured reasons, never for taste.
Logo in the header	112 × 40 desktop 95 × 34 phone	Plus the lockup's own clear space: the paddle-handle height on all sides, minimum width ≈72px.
Header art clearance	20px	No header image comes within 20px of the navigation's right edge — a floor, not a target. Art starts at whichever lands further right, this or the lockup's clear space.

Controls and hit areas

These are accessibility floors, measured on real frames rather than assumed. A control that misses them is a defect, not a style choice.

CONTROL	SIZE	RULE
Nav item, phone	53–58 × 44	44px tall is what took the bar to 56px. A 44px min-width with 5px padding, so a short word is still a full target.
Nav item, desktop	44–71 × 40	Desktop gets the lower bar it needs — but never below the 24px minimum that applies to any pointer target.
Footer link	169 × 44	Two columns on a 375px frame, 12px gutter, 14px row gap. The gap stays: at ±30px, 9.3% of touches land on it and do nothing, which is the right outcome for a slip.
Rewards pill	44 tall	Drops "Get the" below 370px — ★ Get the App at 375 and up, ★ App below.
Social icon	≈20px glyph 44 × 44 target	The padding does the work. Bone fill on the navy footer — never the platform's own brand colour.
Every pill, without exception	1.5px ring	A bone #F5F1E8 ring, box-shadow: 0 0 0 1.5px . Not decoration: cedar on navy measures 2.43:1 and navy on cedar 2.20:1, both under the 3:1 a control's boundary requires. The ring is the only thing giving the pill an edge.

The fuel price block, which has the tightest numbers on the site

It is on every page, it is the most-used thing here, and it carries no artwork at all — it is a table. Nothing is ever supplied for it. The sizes are listed because they set the space everything near it has to work in.

STATE	DESKTOP	PHONE
Resting card Location + Truck Stop	400 × 110	345 × 102
Condensed bar The page's own Location alone	400 × 39	one line
Never wider than	400px	400px
Cost before any page content	—	191px

On a phone that 191px is control 45 + gap 10 + block 135, on every page, with the sticky header holding a further 56 above it. It is why a fourth element above a page title gets measured before it gets added.

Three numbers that disagree between sources — check before you build to them

Found while assembling this section, and left visible rather than quietly resolved, because picking one at random is how a wrong number becomes the agreed one.

The resting card height. Skill fuel-price-update gives the desktop resting card as 400 × 110 in its state table and as 400 × 151 in the sentence above it. The condensed bar width is 400px in one table and 360px in the prose. The phone header is 56px since tap targets were measured (ADR 0010), but the promo stacking arithmetic still adds it as 52, so the "page title at 424px" figure is 4px light. None of the three changes a design decision; all three would waste an afternoon if built to blind.

Every image slot, at the size it renders

CSS pixels are what the browser draws. **Supply at 2× those numbers** so the art holds on a retina screen. The content column caps at 1200px wide; the phone column is about 351px at a 375px device.

SLOT	DESKTOP (CSS PX)	PHONE (CSS PX)	SUPPLY AT	FORMAT
Promo One master serves every slot — see section 08	1200 × 240 (5:1) down to 290 × 163	351 × 197 (16:9)	2400 × 1350 subject inside the centre 2400 × 480	JPG
Info page hero The page a promo links to	1200 × 200 (6:1)	351 × 140	2400 × 400	JPG
Tenant page hero Independent businesses on site	1200 × 190	351 × 132	2400 × 380	JPG
Tenant card thumbnail On the index, 3 across	391 × 78 (5:1)	351 × 78	782 × 156	JPG
Rewards app screenshot	8:5 box (1.6)	8:5 box	2× the rendered box	PNG
Page backdrop — wide Cropped at the page edge, ~10% opacity	866 × 2948 renders ≈186 wide	hidden	as supplied	PNG, alpha
Page backdrop — narrow	503 × 2948 renders ≈108 wide	hidden	as supplied	PNG, alpha
Motif tile, single	≈68 wide	≈68 wide	vector	SVG mask
Motif strip, four-up	≈272 wide	not used	vector	SVG mask
Social share card Not an on-page slot — see section 07	1200 × 630	same file	1200 × 630 not 2×	JPG
Social icon One per account, in the footer social row	≈20 glyph in a 44 × 44 target	same	vector	inline SVG
Waterline band	full width × 18	full width × 18	vector	SVG

Social icons are drawn here, not fetched from the platform

Each social icon is a single inline SVG held in this repository, filled with `--lb-bone` — never the platform's own colour, never its official badge or follow button, and never a file served from the platform's servers. The reason is not aesthetic. An official widget loads third-party code and sets a cookie before anyone clicks it, and the footer's own base row states in plain words that this site sets no cookies. So the icon set is a drawing job: Facebook, Instagram and Yelp, in that order, Yelp last because customers speak there and the business does not.

Location cards carry a 26 × 26 motif, not a photograph — do not supply store photography for them. The fuel-price block carries no art at all: it is the most-used thing on the site and it is a table.

Motifs ship as masks, not as coloured artwork

Supply decorative motifs as **white-on-transparent SVG**. The site uses them as a `mask-image` over a brand colour, so the shape comes from your file and the colour comes from the token layer. That is deliberate: a motif then cannot introduce an off-brand colour, and re-tinting every motif on the site is one value. A motif supplied as flat coloured art cannot be used this way.

1200 × 630, and the square crop is what decides the layout

The image a platform shows when somebody pastes a link to this site into Facebook, LinkedIn, Slack, iMessage, WhatsApp or X. It is the most-reproduced image the brand has off-site, and the only one third parties cache and keep. Full rules in ADR 0022.

1200 × 630 · outer margin 60 · title-safe box x 315–885, y 60–570

The same file is shown at three different aspect ratios

WHERE	RATIO	CROP OF 1200 × 630	WHAT IS LOST
Facebook feed, LinkedIn, Slack unfurl	1.91:1	1200 × 630	Nothing — shown whole
X, <code>summary_large_image</code>	2:1	1200 × 600	15px off the top and bottom
WhatsApp, many mobile chat thumbnails	1:1	630 × 630	285px off each side

The square is the binding crop. Compose for it: the lockup and every word sit inside the centred title-safe box, and everything outside it is ground, texture or photography that can be lost without the card failing.

Supply

ITEM	VALUE	NOTES
Canvas	1200 × 630	1.905:1
Outer margin	60	Nothing of consequence nearer any edge
Title-safe box	570 × 510	Centred. The lockup and all text live inside it
Lockup width	570 max	The on-dark 3× art is 1008 wide, so it is always downsampled
Ground	#1C4E8F	Opaque navy, or full-bleed photography
Format	JPG	Quality 75–82, sRGB, EXIF stripped. Never PNG with alpha
Weight	< 200 KB	
Files at launch	1 required	One sitewide default. Then the three Locations, then <code>/truck-stop</code>

This is the one asset on this sheet that is *not* supplied at 2×

Everywhere else, export at twice the CSS size. Not here: 1200 × 630 is the delivered pixel size, platforms re-encode to their own dimensions, and a 2400 × 1260 file buys nothing but weight. The floor matters more than the ceiling — **below 600 × 315 the large card silently degrades to a small square thumbnail** beside the text, with no warning and no error.

Nothing that can go out of date may be drawn on this card

No fuel prices, no price of any kind, no phone number, no hours, no address. Platforms cache an unfurl against the page URL for days to indefinitely, so a card outlives the fact printed on it — and a link already shared keeps the old image even after the file is replaced. A new card ships as a **new filename**, never an overwrite.

The page title and description are live text supplied by the platform beside the image, so **do not set the page title inside the artwork** — it appears twice. A short standing line is fine; unlike a promo, nothing is overlaid on this image.

No tribal motif on a share card until the approved art exists

Interim motifs elsewhere get swapped before launch. A card that has been scraped cannot be recalled — it sits in other companies' caches. The waterline is the single exception, being an abstract gradient wave band rather than formline.

The card is a lockup slot, so the paddle icon carve-out does **not** apply: a bare paddle never stands in for the lockup here, whatever the crop does.

The width ladder, and why art must survive a re-crop

The promo region is a stack of rows. Each row decides how many promos it holds — one, two, three or four across — drawn from a twelve-column grid with 14px gutters inside the 1200px content width.

ROW LAYOUT	COLUMNS	SLOT WIDTH	SUPPLY AT 2×	CROP	APPROVED
1 across — full width	12	1200 px	2400 px	5:1 → 1200 × 240	
2 across — wide half	8	795 px	1590 px	3:1 → 795 × 265	
2 across — halves	6	593 px	1186 px	3:1 → 593 × 198	
3 across — thirds	4	391 px	782 px	2:1 → 391 × 196	
4 across — quarters	3	290 px	580 px	16:9 → 290 × 163	

All five crops were signed off on 16 September 2026 and recorded in ADR 0023 — build to them. What was already locked is the column ladder and a 150px minimum slot height; the crops clear that floor and hold every row height inside a consistent band (163–265px). The working behind them, measured in a browser, is in [docs/proofs/promo-crop-ladder.html](#).

A row re-divides when a promo expires, so the art gets re-cropped

Twelve divides evenly by 1, 2, 3, 4 and 6. That is the point: a three-across row holding two live promos becomes two halves, and holding one it becomes full width — a hole can never appear. The consequence for you is that a **promo you designed as a quarter may be displayed as a half or full width**, without anyone re-supplying art.

So keep the subject centred, away from the edges, and never let the composition depend on a specific crop. On a phone every row collapses to one column regardless of its desktop layout.

Supply one master per promo — 2400 × 1350, subject inside the centre strip

16:9 is the tallest crop on the ladder and 5:1 the widest, so a 16:9 master is only ever cut from the top and bottom — never horizontally. **Supply 2400 × 1350 and keep the subject inside the centre 2400 × 480 band**, and the same file serves all five desktop slots and the phone. One file per promo — not two, and not one per ratio.

That centre band is where the full-width 5:1 crop lands; everything above and below it is breathing room the narrower slots use. Anything that has to be seen — a face, a product, a logo on a cup — belongs inside the band.

Never bake copy into a promo image

Eyebrow, headline, body and button are **live text fields** the store staff type, laid over your image. Text inside the artwork will be duplicated, will not translate, will not scale on a phone, and will not be readable by a screen reader. Supply imagery only — and leave the image dark enough, or quiet enough, in the area where that text sits.

How much text, signed off 16 September 2026: three fields — eyebrow, headline, button — on every slot and every device. There is no body field. The headline is capped at **28 characters**, which is short enough that nothing wraps: the text block is **89px tall in every slot on every device**. The button label is editable too, and defaults to “See details”. In the tightest slot — the 290 × 163 quarter — that block covers 55% of the frame, so **treat the bottom half as the clear picture area** and compose the subject there.

Tribal motifs are **not** permitted in the promo region. It already competes for attention; decorating it makes the page shout twice.

Never name a promo file ad , advert , banner **or** sponsored

Those exact strings sit on every ad-blocker filter list and are matched against filenames, class names and ids. A first-party promo named that way is silently hidden from a large share of visitors, with nothing in the build to indicate anything is wrong. Name files for what they show — `piroshky-winter-2026.jpg` , not `promo-banner-3.jpg` .

There is a hard 100 MB ceiling on the whole library

The content system's free tier allows 100 MB of assets in total, across the entire site, forever. A real set of store photography exceeds that on its own — so file weight is a live constraint on what can be commissioned, not a technical footnote.

ASSET	FORMAT	TARGET WEIGHT	EXPORT NOTES
Promo, full width	JPG	< 200 KB	Quality 72–80, sRGB, progressive
Promo, half or smaller	JPG	< 120 KB	as above
Page or tenant hero	JPG	< 250 KB	as above
Card thumbnail	JPG	< 60 KB	as above
Anything with transparency	PNG-8 where possible	< 150 KB	Flat art rarely needs PNG-24
Motifs, waterline, icons	SVG	< 10 KB	Outline all text before export

At an average of 250 KB, 100 MB is roughly 400 images for the life of the site. Strip EXIF, convert to sRGB, and do not upload camera originals. If the photography library is going to be large, that is a decision to raise early — the alternatives are hosting images outside the CMS or changing plan, and both are cheaper to choose than to retrofit.

Watch for bitmaps wearing an SVG costume

A file ending `.svg` is not necessarily vector. One supplied to this project turned out to be a single base64 PNG in an SVG wrapper, with zero `<path>` elements and none of the benefits. To check in five seconds, open it in a text editor: `<path>` or `<polygon>` means real vector; `<image>` with `base64` means a bitmap. Also confirm the root element has a `viewBox`, and that text has been converted to outlines — live `<text>` reflows wherever the brand font is not installed.

Slots that exist but have no approved specification

Flagged so nobody produces artwork against a number that was never agreed.

ITEM	STATUS	WHAT IS MISSING
All tribal motifs	PLACEHOLDER	Every motif on the site is an interim silhouette. Authentic, commissioned or tribe-approved art must replace them before launch.
Tenant artwork	SETTLED 17 SEP 2026	Ownership decided that tenants are advertised: a tenants page with a card each. So the card thumbnail and page hero above are live slots, not hypothetical ones. What is still missing is the artwork itself, and it is not ours to draw — each tenant supplies their own, and an external card may carry no art at all. Commission nothing; collect it.
Map on the contact page	WAITING ON THE MAP	The mechanism is settled — an embedded Google My Maps behind a click-to-load still image (ADR 0019, ADR 0025) — so there is no pin artwork to draw: My Maps supplies its own. What is outstanding is one asset, and it cannot be made until the map is: a picture of the finished map , which is what a visitor sees until they click to load the live one. Until then both map fields stay empty, and an empty map renders one section fewer, not a broken page.
Social icons	ACCOUNTS SUPPLIED	Three accounts are in hand and in render order. The three glyphs still have to be drawn as inline SVG — see section 06. Nothing renders while the list is empty, so a missing icon is a blank row, never a broken link.

Do and don't

DO

- Make navy dominant. Teal and cedar are accents, and the waterline is the recurring signature that ties pages together.
- Supply one 2400 × 1350 master for every promo, with the subject inside the centre 2400 × 480 band. It serves all five desktop slots and the phone.
- Export at 2× the CSS size listed, in sRGB, with EXIF stripped.
- Keep the subject centred in promo art, so it survives a row re-dividing.
- Send motifs as white-on-transparent SVG masks.
- Mark every placeholder motif `TODO: replace with approved Lummi art`.
- Compose the share card for the centred square — 285px is cut off each side in a chat thumbnail.
- Name files for what they show.

DON'T

- Touch the logo — no redraw, no recolour, no re-typeset, no extracting a piece of it.
- Sample a colour out of the logo art. `#000F9F` and `#1D3D7C` are not UI colours.
- Set body copy or small labels in teal or cedar. They fail AA on light grounds.
- Bake headlines, prices or buttons into a promo image.
- Use `--1b-navy-deep` for decoration. It belongs to fuel prices.
- Put artwork in the promo region, the fuel-price block, or behind body copy.
- Draw Coast Salish formline, or pass interim art off as final.
- Put a price, a phone number or opening hours on a share card. It is cached for weeks after the fact changes.
- Add a typeface or a colour that is not on this sheet.

Specifications are drawn from the project's locked brand system and its recorded architecture decisions. A figure derived rather than approved carries a **PROPOSED** marker — treat those as a question to settle, not a number to build to; there are none left on this sheet. Section 09 lists what is still open. Anything not covered here is a question worth asking before the artwork is made rather than after.
